RideShare - Carpooling App

"RideShare" is a user-friendly mobile app which is designed to connect individuals wanting to share rides. RideShare facilitates carpooling by enabling users to both offer and search for rides, through an intuitive interface. Users can either offer rides by specifying their starting point, destination and available space, or search for existing rides matching their needs. This dual functionality allows users to either contribute by offering spare seats or find convenient, cost-effective rides. Built for simplicity, RideShare leverages Google Maps and other essential interfaces for payment and communication. Drivers and passengers have access to detailed user profiles, enabling them to make informed decisions based on past trip history, preferences, and reviews. Users can visualize routes before confirming rides, ensuring optimal journey planning and efficiency. Seamless communication between drivers and passengers is facilitated through a built-in chat feature, ensuring smooth coordination and updates during the journey. The app quantifies the environmental impact of each user's travel behavior, showcasing the collective reduction in carbon footprint achieved through carpooling for each user in the form of badges, thereby instilling a sense of achievement. Users can rate and review drivers, promoting accountability and enhancing the overall user experience. By encouraging carpooling, RideShare aims to reduce traffic congestion, lower transportation costs for users, and contribute to a more environmentally friendly and connected community.
